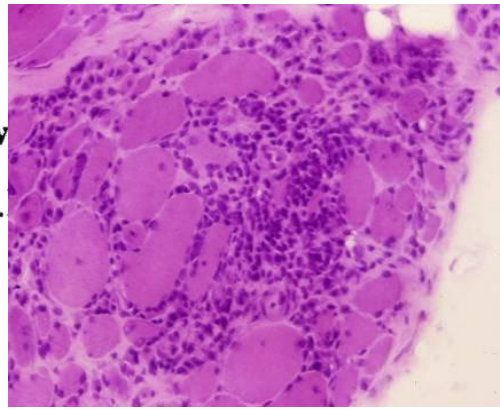
MEDICAL PROGRESS

POLYMYOSITIS AND DERMATOMYOSITIS (First of Tw

ANTHONY BOHAN, M.D., AND JAMES B. PETER, M.D., PH.



1. Symmetrical proximal muscle weakness;
2. Muscle biopsy abnormalities :
    1. Muscle fiber destruction and regeneration;
    2. Perivascular and interstitial inflammatory infiltrates with muscle fiber destruction.
3. Elevation of CPK, Transaminases, LDH or aldolase activity;
4. Myogenic electromyography changes;
5. Typical skin rash.

- DEFINITE: any 4 of the criteria
- PROBABLE: any 3 of the criteria

NEUROLOGICAL PROGRESS

Inclusion Body Myositis and Myopathies

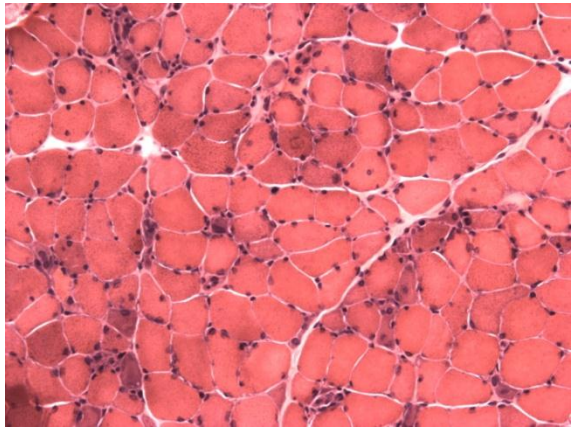
Workshop report

119th ENMC international workshop: Trial design in adult idiopathic inflammatory myopathies, with the exception of inclusion body myositis, 10–12 October 2003, Naarden, The Netherlands

Jessica E. Hoogendijk[a,*], Anthony A. Amato[b], Bryan R. Lecky[c], Ernest H. Choy[d], Ingrid E. Lundberg[e], Michael R. Rose[f], Jiri Vencovsky[g], Marianne de Visser[h], Richard A. Hughes[i,1]

Immune-mediated necrotizing myopathy



1. All clinical criteria with the exception of rash
2. Elevated serum CK
3. Other laboratory criteria (1 of 3) EMG, MRI, auto-Abs
4. Muscle biopsy criteria include *g*, and exclude all others

Necrosis + regeneration without inflammation

2017 European League Against Rheumatism/ American College of Rheumatology classification criteria for adult and juvenile idiopathic inflammatory myopathies and their major subgroups

Table 1 Demographic data of the International Myositis Classification Criteria Project cohort

	IIM (n=976)	Comparators (n=624)
Sex, n (%)		
Female	652 (66.8)	369 (59.1)
Male	324 (33.2)	255 (40.9)
Adult onset disease*, n (%)	727 (74.5)	509 (81.6)
Childhood onset disease*, n (%)	249 (25.5)	115 (18.4)
Age at onset of symptoms, median (IQR), years	44.0 (14.7–57.0)	41.0 (20.0–56.0)
Age at diagnosis, median (IQR), years	45.5 (16.2–59.3)	45.0 (25.8–58.0)

- One unique MSA: anti-Jo1
- 3 subgroups: (J)DM, PM, IBM

Table 4 Performance of the EULAR/ACR classification criteria for IIM and existing classification and diagnostic criteria for IIM

Performance (%)	EULAR/ACR classification criteria for IIM*		Bohan and Peter† [7 8]	Tanimoto *et al*† [10]	Targoff *et al*† [11]	Dalakas and Hohlfeld† [14]	ENMC Hoogendijk *et al*† [15]
	Without muscle biopsy	With muscle biopsy					
Mean (95% CI)							
Sensitivity	87 (84 to 90)	93 (89 to 95)	98 (96 to 99)	96 (94 to 97)	93 (90 to 95)	6 (5 to 8)	52 (48 to 55)
Specificity	82 (77 to 87)	88 (83 to 93)	55 (50 to 61)	31 (25 to 37)	89 (84 to 92)	99 (98 to 100)	97 (95 to 98)

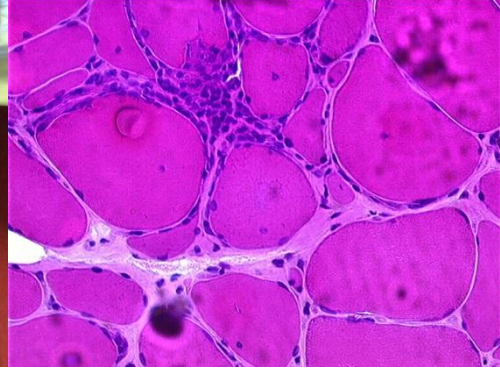
Classification Criteria for Idiopathic Inflammatory Myopathies

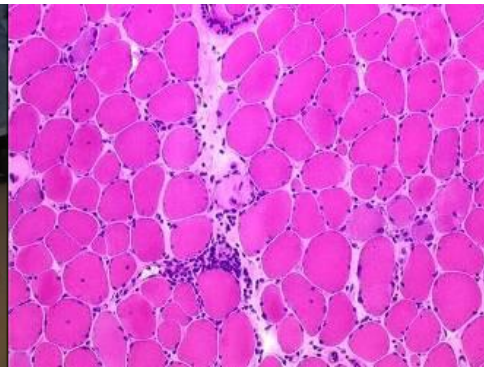
About the Criteria | About the Webcalculator | Download Excel Worksheet

Score range	0 – 20.7
Probability (min – max)	0 – 100%
Classification	
Subgroup	

		Yes	No
Age of onset of first symptom	0 – 17	☐	
	18 – 39	☐	
	40+	☐	
Objective symmetric weakness, usually progressive, of the proximal upper extremities		☐	☐
Objective symmetric weakness, usually progressive, of the proximal lower extremities		☐	☐
Neck flexors are relatively weaker than neck extensors		☐	☐
In the legs proximal muscles are relatively weaker than distal muscles		☐	☐
Heliotrope rash		☐	☐
Gottron's papules		☐	☐
Gottron's sign		☐	☐
Dysphagia or esophageal dysmotility		☐	☐
Anti-Jo-1 (anti-Histidyl-tRNA synthetase) autoantibody positivity		☐	☐
Elevated serum levels of creatine kinase (CK) or lactate dehydrogenase (LDH) or aspartate aminotransferase (ASAT/AST/SGOT) or alanine aminotransferase (ALAT/ALT/SGPT)		☐	☐
Endomysial infiltration of mononuclear cells surrounding, but not invading, myofibers		☐	☐



1) 74 yo man with proximal and distal weakness with dysphagia, invaded fibers but no vacuoles at the muscle biopsy.
Score of 7, with a probability of 64% : IIM type PM.
But IBM!



2) 22 yo man with proximal weakness, with endomysial infiltration of mononuclear cells surrounding, but not invading, myofibers.
Score of 9.2, with a probability of 94%: definite IIM subtype PM.
But dysferlinopathy (LGMD2B)!

Actual classification of myositides

- Dermatomyositis, 30% paraneoplastic
- Inclusion body myositis

- Polymyositis

- Overlap myositis (Troyanov)
  - Myositis associated to a connective tissue disease
  - Myositis with associated Abs (PmScl, Ku …)
  - Myositis with specific Abs (anti-synthetases, anti-SRP…)
- Immune mediated necrotizing myopathies (Hoogendijk) with anti-SRP+, anti-HMGCoA Reductase+ (post-statines), or paraneoplastic

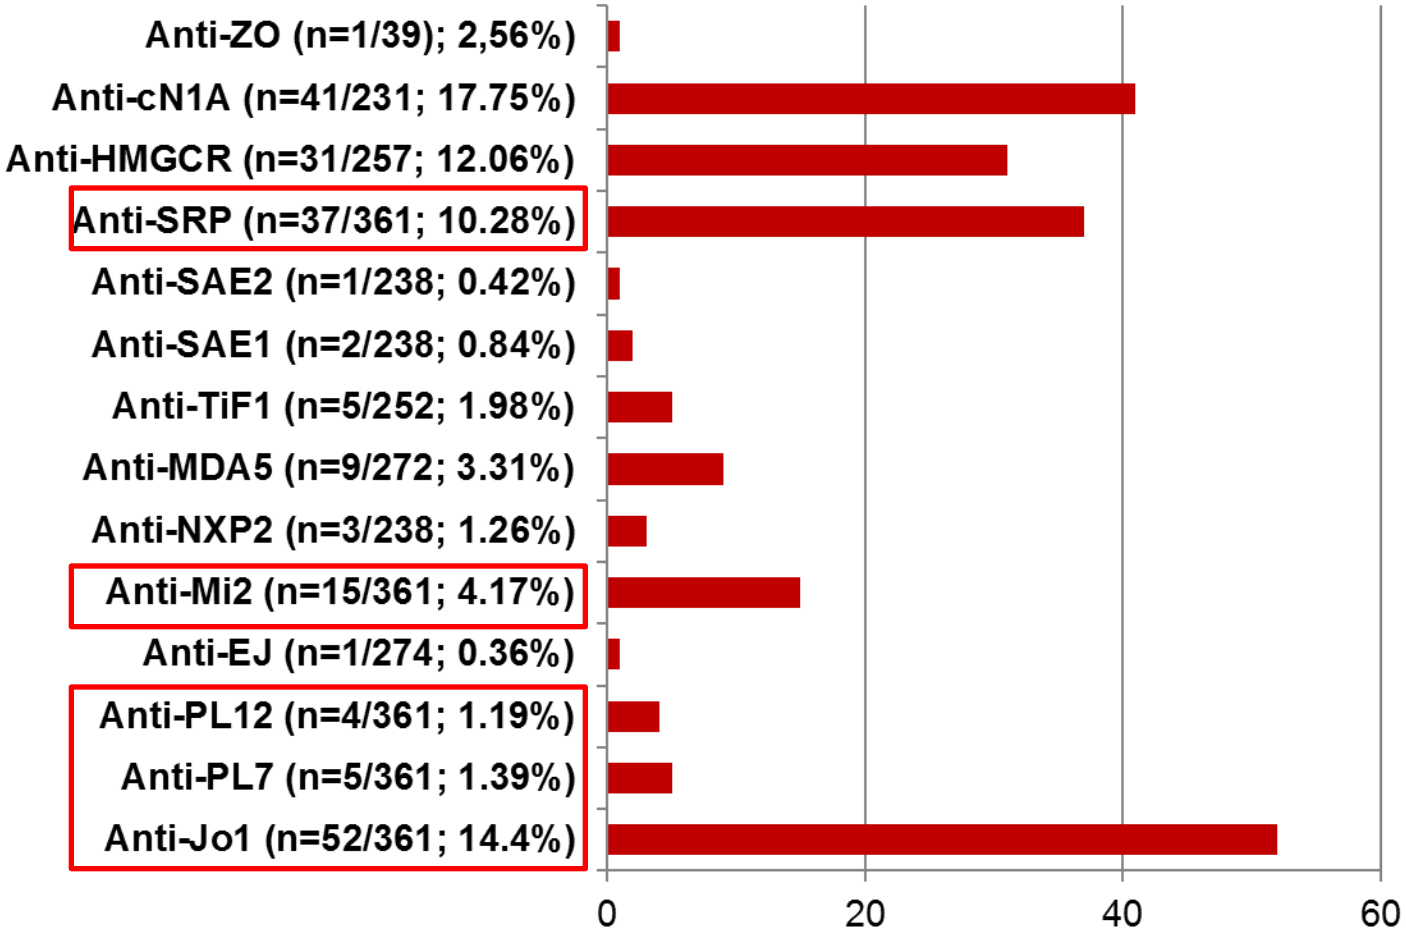
Registry of Myositis in Neuro-Muscular Diseases Reference Center (GHPS)
N= 1150
Dot myositis not done
(n= 643)
MSA panel evaluation performed
period 2003-2014
N=507
Myositis not defined
(n=62)
Myositis defined according to historical classifications
N= 445
Files not available or lack of relevant data
(n=84)
Patient's files included for pre-analytical phase (step 1)
N= 361 (708 variables)
Patient's files included for analytical phase (step 2.1)
N=361 (47 variables)
Patient's files with missing data (at least one) (n=101) (step 2.2)
Patient's files for the new classification (MCA, HCA and CART)
N=260 (47 variables)

Step1 : pre-analytic phase

- Presence of MSA: 207/361 patients (57.34%)

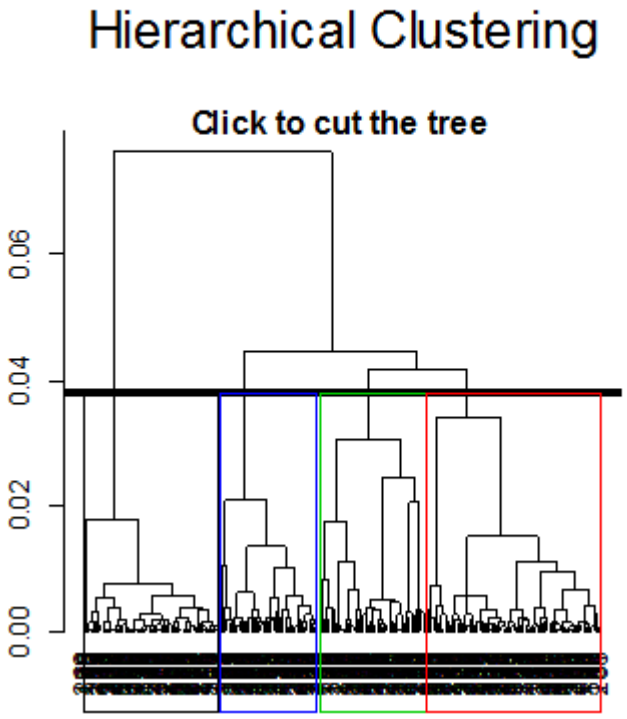


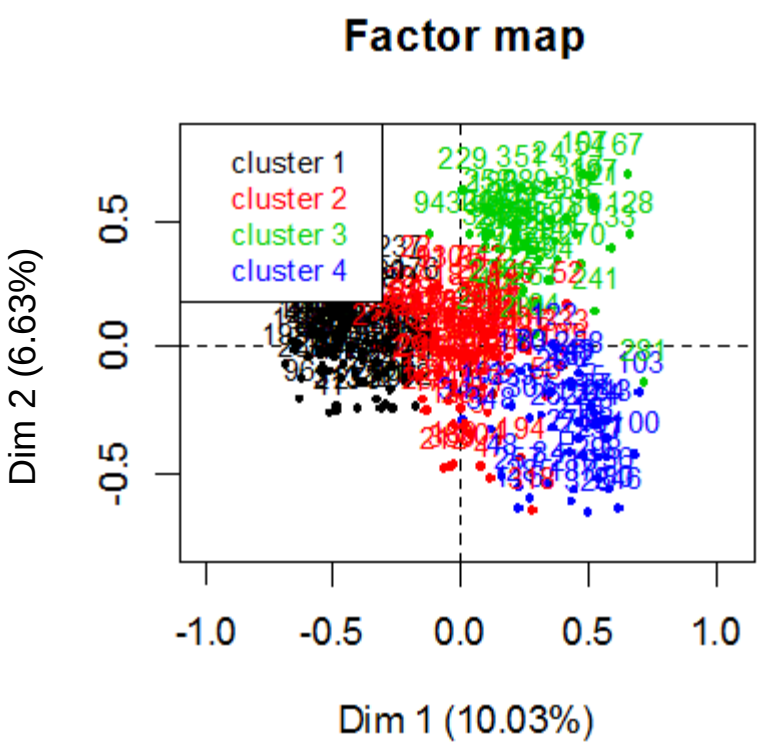
Step 2: analytic phase

- 47 variables used for multiple correspondence analysis (260 patients):

Type of variables	Variables selected
Sociodemographic variables	patient number, gender, age at diagnosis, ethnicity
Skin lesions variables	Skin lesions criteria, shawl signs, typical DM skin rash, heliotrope rash, alopecia, calcinosis, limb edema, panniculitis, skin ulcers and mechanic's hands
Biological variables	CK level (highest), anti-synthetase autoantibodies (grouping anti-Jo1, anti-PL7 and anti-PL12), anti-Jo1, anti-Mi2, anti-SRP, ANA, anti-Ku, anti-PmScl, anti-RNP, anti-Scl70, anti-Sm, anti-SSARo52, anti-SSARo60, anti-SSB
Histological variables	necrotic fibers, mitochondrial abnormalities, perifascicular atrophy, vacuolated fibers, inflammatory infiltrates, inflammatory infiltrate invading non-necrotic fibers and perivascular infiltrates
Muscular variables	Proximal/distal/axial muscle weakness, swallowing troubles, Manual muscle testing (MRC scale) for the deltoids, psoas, quadriceps and finger flexors,
Extra-muscular variables	cancer (± 3 years of the myositis diagnosis), arterial hypertension, Raynaud's phenomenon, lung specific involvement, arthritis/arthralgia,

Step2: Hierarchical Cluster Analysis (HCA)

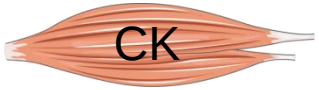




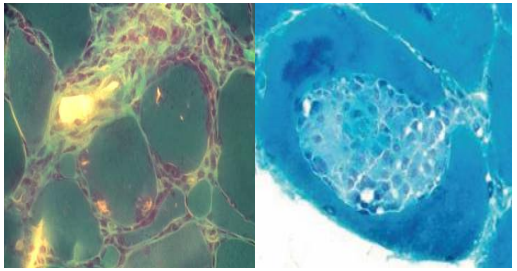
HCA: cluster 1 (n=77, 29.6%)

IBM (n=72, 93.51%; p<0.0001)

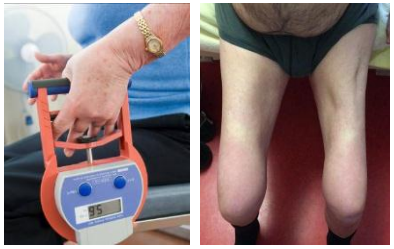
- Men (n=74, 96.11%; p<0.0001)
- Caucasian origin (n=63, 81.82%; p<0.0001)
- ≥ 60 yo (n=58, 75.32%; p<0.0001)



- 160 IU/L ≤ CK ≤ 793 IU/L (n=33, 42.86%; p<0.0001)



- Inflammatory infiltrates (n=77, 100%; p<0.0001)
- **Vacuolated fibers** (n=62, 80.52%; p<0,00001)
- invaded fibers (n=52, 67.53%; p<0.0001)



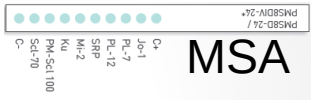
- **Fingers flexors ≤ 3** (n=48, 62.34%; p<0,00001)
- Quadriceps ≤ 3 (n=47, 61.04%), p<0.0001)
- Deltoïd=5 (n=28, 36.36%; p < 0.0001)
- Swallowing troubles (n=59; 76.62%; p = 0.0001)

- No skin, lung, Raynaud, arthritis, MSA …

HCA: cluster 2 (n=52, 20%)

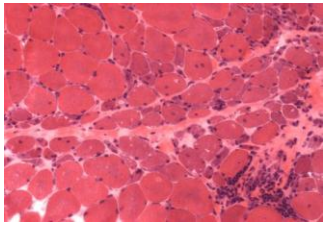
DM (n=43, 82.69%; p < 0.0001)

- Age at diagnosis ≤ 40 (n=19, 36.54%; p <0.0001)
- **DM skin rash** (n=46, 88.46%), **heliotrope rash** (n=39, 75%), **shawl sign** (n=42, 80.77%; p<0,00001)
- Limb eodema (n=18, 34.62%; p<0,0001), Skin ulcers (n=9, 17.31%; p<0.0001), Alopecia (n=10, 19.23%; p=0.001), Panniculitis (n=4, 7.69%; p=0.002), Calcinosis (n=5, 9.62%; p=0.0007)



- **Anti-Mi2** (n=10, 19.23%; p<0.00001)

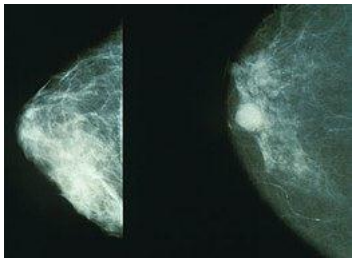
+ Anti-MDA5 (n=3, 8.11%; p=0.02) **+ anti-TiF1gamma** (n=2, 5.56%; p=0.04) **+ Anti-SAE1** (n=2, 6.06%; p=0.05)



- Perifascicular atrophy (n=29, 55.77%; p<0,0001),
- Inflammation (n=46, 88.46%; p<0,0001) with perivascular infiltrates (n=35, 67.31%; p<0.0001)

- Deltoïds ≤ 3 (n=29, 55.77%; p < 0.0001)

- Cancer (n=11, 21.15%; p=0.02)



HCA: cluster 3 (n=40, 15.39%)

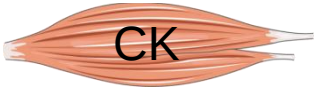
ASyS (n=36; 90%) **or PM** (n=38, 95%) **and 2 DM** (p < 0.0001)

- Age at diagnosis ≤ 40 yo (n=15, 37.5%; p<0.0001)
- African origin (n=9, 22.5%; p<0.0001)

- **Mechanic's hands** (n=22, 55%; p < 0.00001)

- ILD (n=34, 85%; p<0.0001), FVC≤70 (n=19, 55.88%; p=0.0002)

- Raynaud phenomenon (n=17, 42.5%; p < 0.0001)
- Arthritis/arthralgia (n=36, 90%; p < 0.0001)



- ≥7000 IU/L (n=15, 37.5%; p<0.0001)

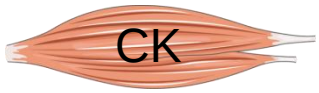
- **Anti-Jo1** (n=31, 77.5%; p<0.00001)

+ anti-PL7 (n=3, 7.5%; p=0.02), **anti-PL12** (n=2, 5%; p=0,05)

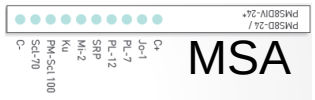
HCA: cluster 4 (n=91, 35%)

IMNM (n=53, 58.24%; p<0,0001) or **PM** (n=21, 23.08%; p < 0.0001)

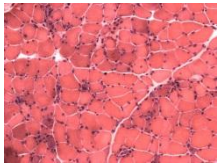
- Women (n=66, 72.53; p < 0.0001)
- Asian origin (n=17, 18.68%; p < 0.0001)



- **≥ 2300 IU/L** (n=58, 63.74%; p<0.00001)



• **Anti-SRP** (n=23, 25.27%; p<0.00001), anti-Ku (n=5, 5.49%; p= 0.03)
+ Anti-HMGCR (n=20, 28.57%; p<0.0001)



- **No muscle inflammation** (p<0,00001), vacuoles, perifascicular atrophy, nor mitochondrial abnormalities

- Psoas ≤3 (n= 57, 62.64%; p=0.02), Quadriceps = 5 (n=40, 43.96%; p<0.0001)
- Fingers flexors = 5 (n= 59, 64.84%; p<0.0001)

- No skin lesion

First series of cases

ANTIBODY TO SIGNAL RECOGNITION PARTICLE IN POLYMYOSITIS

IRA N. TARGOFF, ARTHUR E. JOHNSON, and FREDERICK W. MILLER

Arthritis and Rheumatism, Vol. 33, No. 9 (September 1990)

- 13 patients PM
- « Some of these cases were unusually severe and/or of rapid onset »
- « Anti-SRP antibodies may serve as a marker for a second (after Jo1), distinct subgroup of adult PM »

Myopathy with antibodies to the signal recognition particle: clinical and pathological features

T Miller, M T Al-Lozi, G Lopate, A Pestronk

J Neurol Neurosurg Psychiatry 2002;**73**:420–428

- 7 patients with severe myopathy
- ± cardiomyopathy (30%)
- High CK level (> 10 000 U/L)
- Sometimes skin rash or interstitial lung disease
- Muscle fiber necrosis and regeneration and little or no inflammation

REPORT

High risk of cancer in autoimmune necrotizing myopathies: usefulness of myositis specific antibody

Yves Allenbach,[1,2] Jeremy Keraen,[1] Anne-marie Bouvier,[3] Valérie Jooste,[3] Nicolas Champtiaux,[1] Baptiste Hervier,[1] Yoland Schoindre,[1] Aude Rigolet,[1] Laurent Gilardin,[1] Lucile Musset,[4] Jean-Luc Charuel,[4] Olivier Boyer,[5] Fabienne Jouen,[5] Laurent Drouot,[5] Jeremie Martinet,[5] Tanya Stojkovic,[6] Bruno Eymard,[6] Pascal Laforêt,[6] Antony Behin,[6] Emmanuelle Salort-Campana,[7] Olivier Fain,[8] Alain Meyer,[9] Nicolas Schleinitz,[10] Kuberaka Mariampillai,[1,2] Aurelie Grados[1] and Olivier Benveniste[1,2]

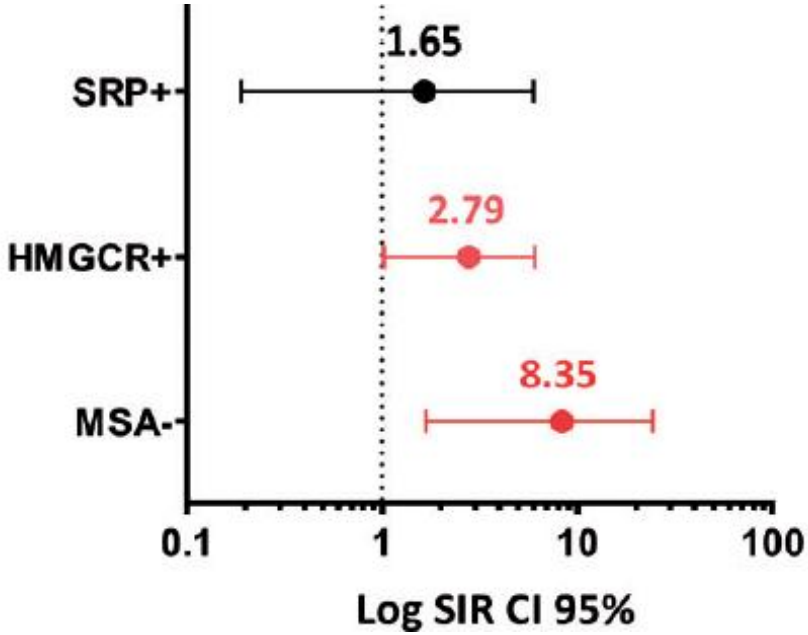

Table 1 Patients' characteristics

	MSA− patients *n* = 14	Anti-HMGCR+ patients *n* = 52	Anti-SRP+ patients *n* = 49	P-values
Age (years) at diagnosis of myopathy	53 ± 15	50 ± 22	47 ± 17	0.6
Statin exposure (%)	7.1 (1/14)	46.1 (24/52)	19.1 (5/26)	**0.004**
Percentage female (%)	73	73.1	67.3	0.8
Muscle strength (MRC)	2.9 ± 1	2.8 ± 0.9	2.1 ± 1.3	**0.0006**
Creatine kinase level (I.U/l)	10 156 ± 14 658	7012 ± 5944	8453 ± 6547	0.39
Dermatomyositis rash (%)	0 (0/14)	0 (0/37)	2.3 (1/44)	0.46

For muscle strength evaluation muscle manual testing was performed using MRC scale (0–5). The mean score of the weakest muscles is represented.
MRC = Medical Research council

IMNM, MSA and cancers

Cancer association as a risk factor for anti-HMGCR antibody-positive myopathy

Interpretation Combined treatment with prednisone and either ciclosporin or methotrexate was more effective than prednisone alone. The safety profile and steroid-sparing effect favoured the combination of prednisone plus methotrexate.

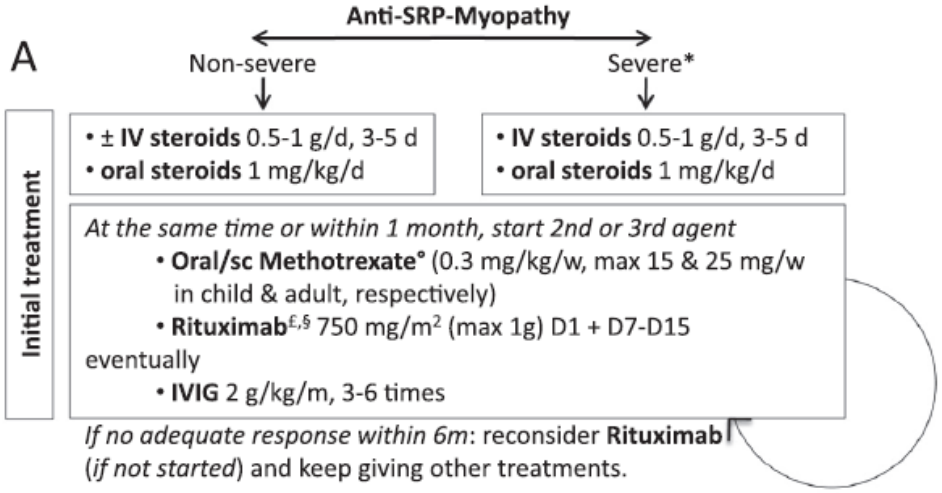
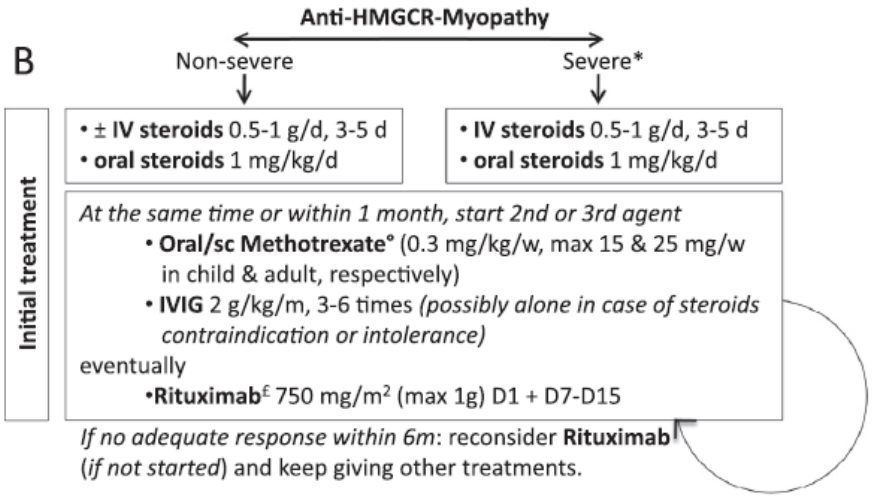
Workshop report

224th ENMC International Workshop: Clinico-sero-pathological classification of immune-mediated necrotizing myopathies Zandvoort, The Netherlands, 14–16 October 2016

Yves Allenbach [a,1], Andrew L. Mammen [b,1], Olivier Benveniste [a,2], Werner Stenzel [c,2,*] on behalf of the Immune-Mediated Necrotizing Myopathies Working Group [3]

Treatment of IMNM





Anti-SRP & anti-HMGCR-Myopathy

Maintenance treatment

- Taper **oral steroids** to the lowest dose as tolareted or as soon as possible (regarding the maximum benefit)
- Continue **Methotrexate** at least 2 years of well-controlled disease (slowly tapered later: 2.5 mg/w each month)
- Continue **Rituximab** every 6 months, at least 2 years of well-controlled disease
- If started **IVIG** are stopped or tapered, as tolerated.Nota bene: many HMGCR+patients may required IVIG
